

HOW TO MAKE A RAINBOW SKITTLES SCIENCE EXPERIMENT?

These simple picture instructions will walk you through step by step through the experiment.

Place your Skittles in a circle around your dish. You could try doing this in different shapes to see what happens. We just tried it by doing a circle.

Once you have completed the circle add in medium temperature water in the middle. Make sure you add enough to go right to the edge of the candy on both sides.

Wait thirty seconds to see the colours begin to come out. The colour will start dissolving away from the shell once you add in the warm water.

Then be completely amazed by your beautiful results! At the end you can have your child mix all the colours together using a toothpick or their finger. You can discuss how when you mix colours together it becomes a brownish colour.
